2022

Context

- FIFA 2022
 - ◆ 22nd edition
 - ◆ First World Cup in the Middle East
- Large Event (1 million people are expected to come (~ 47%))
- A need to manage crowd and traffic on multi-layer transportation network (road/bus/metro)
- A need for a tool to test what-if scenario regarding blocking/opening or enabled/disabled ways

Our Platform - RobSim

'Robustness Simulator'

Architecture

- Data Acquisition
 - ◆ Challenges of processing geospatial data
 - ◆ Geospatial data storage
- Analysis
 - ◆ Roads as a graph
 - ◆ Nodes centrality (How important/critical is a node)
- Visualization
 - ◆ Map-centered dashboard
 - ◆ Development Language

Architecture

- Back-end features
 - ◆ Compiled .json file
 - ◆ Sql database
 - ◆ Models:
 - Computation Metrics
 - Node/ Segments with different attributes
- Front-end features
 - ◆ Development language
 - ◆ On Each Feature
 - ◆ Map-Centered Dashboard

Functionalities

Functionalities

- Visualize metrics
 - ◆ Analyze traffic load, centrality of nodes
 - ◆ Understand importance of certain path/node
- To enable or To disable segments
 - ◆ Visualize the disabled nodes and segments
 - ◆ Store them in database
- Send notifications
 - ◆ Alert traffic police and Urban planners when a network is disabled - Using SMS/Email

Demo
